PROJECT OUTLINE

The database project for Milly's Chocolate Factory aims to create a reliable, normalized relational database system to manage the company's business distribution activities. The core objective is to centralize and optimize data about customers, their accounts, branch operations, employee details, and the complex order fulfillment and item composition procedures. The project will involve designing the database schema within Microsoft Access, utilizing normalization procedures to ensure data integrity. Furthermore, it will also include the development of user-friendly and extensive reporting features. Ultimately, this system is designed to enhance data accuracy, streamline the generation of reports, and establish a solid foundation for informed decision-making throughout Milly's retail distribution network.
